PREPARED FOR THE CLIENT · 20 OCTOBER 2026 · BUILD STATUS

What is built

The four-week delivery plan of 13 October promised two milestones a week. Weeks one and two are complete and deployed to production. This document says what a business owner can do in PPCway today, what runs without anybody touching it, what is not built yet, and the four things the project now waits on the client for.

Nothing below is a plan. Every line is in production at **app.ppcway.com** and can be opened and checked. Where a figure is quoted, it was read from the live system on 20 October, not estimated.

Measured against	The four-week delivery plan of 13 October 2026, itself drawn from Developer Requirements v1.0
Weeks one and two	COMPLETE deployed 20 October
Live at	app.ppcway.com — both services in Montreal, Canada
Running versions	Application 00048, website 00043
Automated tests passing	731, run before every release
Jobs running on a clock	6, all enabled and verified
Week three begins	Otto's recommendation engine — the part that decides what to change

One caution when judging progress by looking at the app: no screen shows invented numbers. Where the design draws something the machinery cannot yet fill, the screen says which week it arrives instead. Figures on the dashboard are the connected account's real figures.

The four phases of the requirements

The requirements set out four phases. The first is built in full and is now sitting out the soak period the requirements themselves impose. The second is most of the way in: everything that reads and explains is done, and what remains is the part that recommends.

PHASE	WHAT IT COVERS	BUILT	WHAT IS LEFT
1. Foundation	Sign-in, a business with people and roles, secrets, a real Google Ads connection, and a copy of the account in our own database kept in step with Google	100%	Nothing to build. The exit gate is a waiting period, counted below.
2. Read and recommend	The dashboard, campaigns, reports, the website audit as a living tool, the weekly email and alerts, and Otto proposing changes without applying them	80%	Otto's recommendation engine — week three
3. Approve and write	Proposed changes, the approval inbox, guardrails, undo, editing campaigns, the expert console	0%	All of it. **Nothing in PPCway writes to a Google Ads account today.**
4. New advertisers	Creating an account for a business that has none, billing, the campaign builder	0%	All of it

Phase 1's exit gate, counted rather than claimed

The requirements will not let PPCway write to anybody's account until five accounts have synced cleanly for seven consecutive days. PPCway counts this itself and reports it, so the gate cannot be declared passed because nobody checked. Read from the live system today:

> **0 of the 5 accounts the gate asks for have 7 clean days. It is running on 1 connected account. The gate is not passed.**
>
> That one account, Byte9, has 5 clean days out of the last 7 across 752 sync runs. It names its own two bad days: 13 October, when no sync ran, and 14 October, when a query asked Google for two fields it had renamed — since fixed. Byte9 alone reaches seven clean days on **22 October**.

What this needs is four more Google Ads accounts to read, not more code. Any live account will do, and connecting one takes about a minute. Until there are five, the gate is arithmetic that cannot complete.

What a business owner can do today

Get in, and connect their advertising

`app.ppcway.com`

- Sign up and sign in two ways: with Google, or with an email address and a password, with a confirmation link and a reset that both send real email.
- Invite their own people, with five roles — owner, admin, member, expert, client viewer — enforced in the system, not just hidden in the interface.
- Connect their Google Ads account by granting permission to Google directly. They choose which single account PPCway may read, and they can disconnect inside the product at any time, which destroys the stored permission immediately.

See what their advertising did, in plain words

`/home`

- Leads, phone calls, form fills, money spent, clicks and views for the last 30 days, with a sentence before every number.
- Each figure carries the change against the period before it — “up 18%”, “down 4%” — so a figure is never shown without saying whether it is better or worse than last time.
- **Needs you**: a short list of real problems, in the owner’s language. “This campaign has spent $240 and brought no leads.” “An ad was refused by Google.”
- **Changed in Google Ads**: anything edited directly in Google in the last seven days, so no change happens behind the product’s back.
- A trend line beside each campaign, and the website’s Visibility Score over time.

Look into any campaign

`/campaigns`

- Every campaign with its spend, leads, clicks and cost per lead, and the dates covered printed on the screen so the figure can be checked against Google Ads and will match.
- Open one campaign for five tabs: overview, ad groups, keywords, ads, and the history of what changed and who changed it.
- A campaign still learning says so, and counts the days until it has learned.

Get a report worth sending to somebody

`/reports`

- Thirty days, ninety days, or this year against last year.
- Every figure gets a verdict **in words, not an arrow**: a real change, normal variation, or too little data to tell yet. The verdict is calculated, so normal weekly noise is never sold as a win.
- A definitions panel that explains each term in one sentence.
- **Share this report** builds a private link that opens with no login and no account. It expires after fourteen days, can be revoked at any moment, and shows that one report and nothing else.

Find out what is wrong with their website, repeatedly

`/tools/audit`

- Fourteen public checks on the Google listing, the website and the competition, with a real crawler, a real browser and a live mobile speed test. A score out of 100 and specific, fixable findings.
- It now **runs again every night by itself**, so the score is current rather than a snapshot of the day somebody asked.
- **Score over time**, and **what changed since last time** — what was fixed, and what broke.
- **Page by page**: the actual pages the ads send people to are opened and judged. Is there a form, a tappable phone number, a clear button? How fast does it load on a phone?
- The fix list can be sent to a web developer as a link that needs no login.

Hear from PPCway without logging in

`by email`

- **Monday morning:** a summary of the week — what was spent, how many leads, what changed, what needs attention.
- **When something is wrong:** spend has suddenly doubled, leads have stopped, an ad was refused, our access to the account was lost, the sync keeps failing, or the website score dropped. Six conditions, and at most one email per issue per day, so the alerts stay worth opening.

Free tools, open to visitors who have not signed up

- The website audit, a budget calculator, a cost-per-lead and ROAS calculator, and an ad copy checker.
- Google's own search volumes turned into a money line — "about 11,280 searches a month for what you do in Oakville, $18 to $53 a click".
- An audit run before signing up follows the person into their account afterwards.

What runs without anybody touching it

Six jobs run on a clock in Canada. All six are enabled and have been seen to work. This is the difference between a dashboard somebody has to refresh and a service that watches an account.

JOB	WHEN	WHAT IT DOES
Structure sync	every 15 minutes	Notices campaigns, ad groups, keywords and ads added, changed or removed in Google Ads
Today's figures	every hour	Brings today's spend, clicks and leads up to date
Nightly catch-up	03:15 Toronto	Re-reads the last three days, because Google revises recent figures for a day or two
Website audit	02:00 Toronto	Re-audits every website in the system so the score stays current
Alerts	every hour	Checks the six conditions above and emails only when one is genuinely met
The Monday post	Mondays 08:00 Toronto	Sends the weekly summary. First send: **Monday 26 October**

> **The alerts job has run every hour today and sent nothing.** That is the correct answer, not a failure: the connected account met none of the six conditions. A system that emails when there is nothing to say trains people to ignore it.

Proved against the live account, not assumed

Four things were run against production on 20 October rather than taken on trust:

- **The gate answers with real data**, naming its own two bad days rather than rounding them away.
- **A full scheduled audit ran by itself**: 11 findings, the search-demand figures, the account's own four checks, and one real landing page opened and judged — a page taken from the live campaign that sends people there.
- **Both login-free links work**, and an unknown link is refused in the same words as an expired one, so a wrong guess learns nothing.
- **Two faults the first live run found were fixed the same day:** one website was queued for audit twice because it had been saved once with a tracking tag on the address and once without; and a finished audit read on its own reported no score while the same audit in a list reported a number.

What is not built yet

WHAT	WHEN	WHY IT IS NOT DONE
Otto's recommendations	week three	The part that decides what to change: pause this keyword, move this budget, add this negative. The reading it depends on is now all in place.

WHAT	WHEN	WHY IT IS NOT DONE
The approval inbox	week four	Approve or reject each proposed change, with guardrails and undo. Blocked on two client decisions, below.
Writing to Google Ads	week four, then a 30-day gate	Nothing writes today. The requirements impose a thirty-day waiting period before automatic changes are allowed, ending 6 December.
Chat with Otto	after week four	The screen exists and says so plainly rather than pretending.
New advertisers	to 20 November	Businesses with no Google Ads account at all, plans and billing, the phone layout.

The four things the project waits on

WHAT IS NEEDED	BY WHEN	WHAT IT BLOCKS
Four more Google Ads accounts connected	as soon as possible	Phase 1's exit gate, which is five accounts syncing cleanly for seven days. One is connected. This is access, not development.
Which change types may apply automatically	**Fri 23 Oct**	Week three's first morning. A fortnight's delay here costs more than everything else on the risk list put together.
The data residency answer	**Fri 23 Oct**	The same. Both services already run in Canada; the question is what must be promised in writing.
A demonstration video for Google	this week	Google's app verification. Google accepted our permission request; the rejection was paperwork. Until it clears, merchants see an "unverified app" warning and the project is capped at 100 connected Google accounts for its lifetime.

PPCway build status, 20 October 2026. Figures read from the live system the same day: application revision 00048, website revision 00043, 731 automated tests passing, 6 scheduled jobs enabled, 1 Google Ads account connected with 752 sync runs behind it.
